

Leonardo Mesquita

Data Engineer | BI & Analytics | Automation & ETL | Full-Stack (Next.js/Python) | DevOps & Observability

Fortaleza, Ceará, Brazil | +55 (85) 99977-4142 | contatoleonardo@gmail.com | srmesquitaa.github.io | linkedin.com/in/leonardo-mesquitaa | github.com/SrMesquitaa

PROFESSIONAL SUMMARY

Self-taught data professional with hands-on experience building and running end-to-end data infrastructure in production - ingestion, transformation, data warehouse modeling (Bronze/Silver/Gold architecture), dashboards and automation. Works across data engineering (Python, SQL, BigQuery, Postgres, ETL pipelines), the application layer (Next.js, REST APIs, authentication, deployment), and observability of the infrastructure itself (Grafana, Prometheus). Proven track record diagnosing and fixing real production incidents (runaway query cost, duplicate data, zero-downtime database migration), always driven by numbers and evidence before acting. Main differentiator: the ability to connect the technical side with business objectives, acting as a facilitator between data and non-technical areas, cutting through jargon to understand leadership's real needs.

PROFESSIONAL EXPERIENCE

BI Analyst / Data Engineer · Amel's Conceito

Fortaleza, Brazil · January 2026 - Present

- Migrated the reporting infrastructure from Google Sheets (90,000+ rows, near the cell limit) into a BigQuery data warehouse, designing and documenting a Bronze/Silver/Gold layered architecture.
- Diagnosed and fixed a runaway job firing 8,000 to 14,000 times a day (against the ~600 expected) using hour-by-hour analysis via `INFORMATION_SCHEMA`; cut the 1,055 runs/hour peak down to 6–12/hour, eliminating unnecessary processing cost.
- Migrated the transactional data consumption layer from BigQuery to Postgres (Supabase) under live production traffic, route by route, with zero downtime, for a sales platform used by ~50 sales reps simultaneously.
- Own and evolve a live sales platform end to end - frontend, database and integrations - serving ~2,500 visitors and ~28,600 page views per month (68% mobile), used daily by the field sales team.
- Implemented production deduplication that removed 694 duplicate records from a 115,000-row table, caused by an external write process with no idempotency check; applied a real-time mitigation plus a historical cleanup backed by a safety snapshot.
- Built ingestion pipelines in Python (Pandas, Requests) integrating multiple sources over REST APIs - Google Drive, Telegram and an in-house CRM - increasing captured data volume by 83% with 100% integrity, replacing a manual process with automated extraction and structured logging.
- Structured KPIs and Power BI dashboards (DAX, Power Query/M) in DirectQuery mode over BigQuery, reviewed weekly by directors and supervisors; built complementary dashboards in Streamlit.
- Ran a commercial productivity analysis across ~35,000 leads, surfacing 10,089 stalled leads (76% untouched for 15+ days) and conversion ranging from 0.6% to 6.6% across reps - used to inform lead book management decisions.
- Led a data-driven infrastructure migration (AWS EC2 → self-managed Linux server): instrumented production scripts with real RAM/runtime metrics before migrating, diagnosed an unstable instance (broken management agent, no static IP, full disk) and migrated in two phases with zero data loss.
- Deployed an observability stack (Grafana + Prometheus + Pushgateway) via systemd after a service sat stuck for 26 hours undetected; instrumented multiple cron jobs with health metrics (success/failure, duration, error count).
- Diagnosed and recovered from a silent production script corruption incident (a manual edit dropped logic with no syntax error) via backup + surgical text-replacement patching, avoiding pasting into an editor again.
- Built Fast-Leads: a WhatsApp lead distribution system with round-robin logic, duplicate caching and 24/7 monitoring, containerized on Docker + Evolution API.
- Built a complete vendor bank-details registration system (Next.js, Supabase, Clerk): a public no-login form plus an authenticated panel split by department (HR/Finance), with real CPF/CNPJ/PIX key validation (check-digit algorithms, not naive regex) and two-layer access control.

- Automated weekly Excel report generation via GitHub Actions reading from Supabase, including fixing a Table/array-formula corruption bug caused by the writer library (ExcelJS), resolved through surgical XML editing.
- Audited and cleaned up a 202-user base (Clerk) via a custom API script: 20 accounts removed and 47 locked for inactivity, with versioned audit scripts.

Junior Data Assistant - Grupo Vilarouca

Brazil · July 2024 - February 2025

- Built strategic Power BI dashboards focused on performance, patterns and trends for the Marketing and Logistics departments.
- Ran full ETL with Python and Selenium: extraction, consolidation and data quality assurance for analytical reports.
- Performed exploratory analysis to identify patterns and align metrics with each department's strategic KPIs.
- Worked with cross-functional Marketing, Logistics and Sales teams.

OPEN SOURCE PROJECTS

pix-chave-validator - validation, classification and formatting of Brazilian PIX payment keys (CPF, CNPJ, email, phone, random). Pure JavaScript, zero dependencies, 22 automated tests, GitHub Actions CI.
github.com/SrMesquita/pix-chave-validator

prometheus-pushgateway-helper - Python library that pushes health metrics for batch jobs (cron/systemd) to the Prometheus Pushgateway. Zero dependencies, tested, multi-version CI.
github.com/SrMesquita/prometheus-pushgateway-helper

TECHNICAL SKILLS

Languages: Python, SQL, JavaScript/TypeScript, DAX, HTML/CSS

Data & Analytics: BigQuery, Postgres, Supabase, Data Warehouse (Bronze/Silver/Gold architecture), relational and dimensional modeling, ETL/ELT, production data pipelines, Power BI, Streamlit, advanced Google Sheets/Excel, Google Analytics

Backend & APIs: Python (Pandas, Requests, Selenium, Playwright), Next.js, Node.js, REST APIs, third-party API integration (Google Drive, Telegram, WhatsApp/Evolution API, Clerk)

Cloud & Infrastructure: Google Cloud (BigQuery), AWS EC2, Vercel, Docker, Linux (administration, systemd, cron), Tailscale/VPN, bare-metal server management

Observability & DevOps: Grafana, Prometheus, Pushgateway, PromQL, monitoring and alerting, GitHub Actions (CI/CD)

Security: pentesting fundamentals (Nmap, Burp Suite, OWASP Top 10), access-control and RLS best practices, currently pursuing a degree in Cybersecurity

Version Control & Collaboration: Git, GitHub (Actions, Pull Requests, code review), technical documentation

EDUCATION

BSc Technology in Cybersecurity - Universidade Cruzeiro do Sul · 2026 - 2028 (in progress)

LANGUAGES

Portuguese: native | English: advanced (technical documentation reading and professional communication)
